

Comply **Safer Cheaper Faster** Together

The **collaborative** low-code platform for **regulatory** reporting
Now ready for FSCA CS3 transaction reporting to Strate

- **Safer** – leverage industry best practices using the Common Domain Model (CDM) and Digital Regulatory Reporting (DRR) natively
- **Cheaper** – integrate open-source software into your firm at low cost and without long-term vendor lock-in
- **Faster** – Rosetta tooling and REGnosys expertise deliver a PoC in weeks and production in a few months

REGnosys are the industry experts: we created the Common Domain Model and Digital Regulatory Reporting using our open-source Rune data modelling language and the Rosetta platform. We continue to manage the models and code base on behalf of FINOS and ISDA.

We are here to help you adopt these capabilities, collaborating with your team and with local partners where appropriate.

Rosetta combines model-driven engineering with the power of open source to solve the industry's data management challenge.

The SaaS platform enables teams to collaborate on modelling internal data formats, map them to the CDM, and create trade repository-ready output using the DRR, all without technology expertise or software development.

DRR-in-a-Box is our run-time solution which can be created from Rosetta and enables deployment inside your firm for internal, private testing, and integration into your production environment for automated creation of regulatory reports ready for the trade repository.
